

a Tool for Model Repair based on Local Instance Graphs

Clear, guided UI for repair

Guided flow for selecting inputs and visualizing intermediate steps

Speed-Accuracy trade-off

Adjustable repair setting to speed up repair, accepting potential lower precision

Quantified & Visible outcome

Original vs Repaired net metrics and repaired components highlighted in red

How ReLIgN works

Starting from a process model, an event log, and a high-level behavior (AB) represented as a Local Instance Graph (LIG), ReLIgN integrates the observed behavior into the model, producing an updated version of the model (Repaired Model) that more accurately reflects the real process execution.

Preserving the original model variability

Model repair powered by graph data

Process models enhanced by your data

Try ReLIgN now
